New Drugs of Abuse

Hannah L. Hays, MD
Fellow, Medical Toxicology
Central Ohio Poison Center
The Ohio State University
Department of Emergency Medicine

Objectives

• Become familiar with the clinical presentation of newer street drugs
• Become familiar with management of patients presenting with intoxication from newer drugs of abuse
• Become familiar with substances commonly found as street drug adulterants
Khat

- Shrub whose leaves are chewed for their effects
- Native to E. Africa & Arabian Peninsula
- Contains cathinone, a natural alkaloid
  - Primary psychostimulant in the plant
  - Present in the leaves

Image from: http://en.wikipedia.org/wiki/Khat

Khat

- Use dates back to ~ 640 A.D.
  - Religious ceremonies
  - Social pasttime
- Emerged in the West in 1980’s
- Highly perishable

Image from: http://en.wikipedia.org/wiki/Khat
## Clinical Effects: Acute

- Typical sympathomimetic presentation
- Tachycardia, Hypertension, Tachypnea
- Diaphoresis
- Agitation
- Psychosis
- Death

## Clinical Effects: Chronic Use

- Thromboembolic events
- Cardiac rhythm disturbances
- Dilated cardiomyopathy
- Hepatotoxicity
- Withdrawal syndrome
- Death
- Cancer?
Coronary Vasospasm & Myocardial Infarction

- Observational studies in Yemen
- Peak daily incidence of MI parallels peak “chewing times”
- MI presents at a younger age in khat users
- Independent risk factor for in-hospital mortality in patients with ACS

Treatment

- Supportive
  - Benzodiazepines
- Admission for:
  - Serious symptoms
  - Suicidal patients

**Status**

- 1993: Cathinone made Schedule I according to the U.S. Controlled Substance Act

![Image from: http://en.wikipedia.org/wiki/Khat](image)

**“Bath Salts”**

- Synthetic designer drug
- Cathinone derivative
- Primary ingredients:
  - “MDPV”: inhibits NE and dopamine reuptake
  - Mephedrone: unknown MOA; likely MAOI, similar to MDMA

![Image from: http://en.wikipedia.org/wiki/Methylenedioxypyrovalerone](image)

![Image from: http://en.wikipedia.org/wiki/Mephedrone](image)
### Bath Salts

- No legitimate use for bathing!
- No legitimate medicinal use!
- Labeled, “not for human consumption”
  - Intended for substance abuse
- Widely available
- Looks like baby powder or flour

### Marketing Tricks

- Legal high
- “Legal cocaine”
- Enhances alertness
- Facilitates relaxation
- Aphrodisiac
- Plant food
- Insect repellent
### Brand Names

- Ivory Wave
- Vanilla Sky
- White Rush
- Charge Plus
- Ocean Snow
- Red Dove
- Cloud Nine

### Route of Abuse

- Oral ingestion
- Intranasal
- Smoked
- Intravenous
  - Less common
  - Bath salts less effective in solution
- Rectal
### Adverse Effects: Acute

- Hypertension, tachycardia, hyperthermia
- Diaphoresis
- Altered mental status
  - Paranoia, panic attacks, psychosis
  - Violence, aggression
- Insomnia
- Extreme psychomotor agitation
- Seizure

### Adverse Effects: Subacute - Chronic

- Long term use leads to tolerance
- Compulsive, repetitive use
  - Intense craving
  - Withdrawal
- Long standing depression and paranoia
  - Resembles schizophrenia
- Suicide and homicide
**Laboratory Evaluation**

- Routine drugs of abuse tests do not detect
  - Can trigger positive amphetamine result
  - Most do not
- Can obtain MDPV and mephedrone levels
  - Send out test to specialized labs
  - Quantitative level using GC/MS

**Other laboratory testing**

- Liver function tests
  - MDPV is metabolized in liver
- Renal function tests
- CPK
  - Rhabdomyolysis not uncommon
Treatment is Supportive

- Quiet room, low lighting
- Benzodiazepines for agitation, hypertension and tachycardia
  - Dexmedetomidine: anecdotal success
- Intravascular volume repletion

Aggressive Cooling

- Usual maneuvers
- May need intubation and paralysis
- Succinylcholine contraindicated
  - Rhabdomyolysis & hyperkalemia
  - Use nondepolarizing agents
- Continuous EEG monitoring if paralyzed
Supportive Care

- Counseling for depression and paranoia
- Drug treatment programs
- Case reports: resolution of paranoia and delirium with antipsychotics
  - After resolution of acute intoxication
  - Low doses used

Legal Status

- DEA emergency ban announced Sept 7, 2011
- Ohio State Law banning bath salts went into effect on October 17, 2011
Levamisole

- Veterinary antihelminthic
- No longer available for human use
- Cocaine adulterant
  - As much as 70% of cocaine in US
- Problem thought to have began in 2003
  - South American cartels

Clinical Effects

- Vasculopathic purpura
  - Characteristic skin lesions
  - Skin necrosis (digits, ears)
- Neutropenia
- Agranulocytosis
- Hyponatremia
  - Mechanism unknown
Treatment

• Supportive
• Cessation of levamisole exposure

Status

• Withdrawn from US Market in 2000
• Banned in US
Clenbuterol

- Potent, long acting \( \beta \)-adrenergic agonist
- Used outside US for treatment of reactive airway disease in humans and animals
- Used by body builders for sympathomimetic, lipolytic and anabolic effects
- Used as an adulterant in heroin and other drugs

January 28, 2005

21 year old New Jersey man hospitalized with an atypical reaction to heroin.

Patient reported chest pain, palpitations and shortness of breath that began soon after intranasal exposure.
Presentation

- Hypotension, Tachycardia
- Pale, diaphoretic skin and mydriatic pupils
- Laboratory testing
  - AGMA
  - Hypokalemia
  - Hyperglycemia
- Patient recovered with supportive care

Following Three Months

- Poison Center reporting led to identification of 25 similar cases
  - 5 different states
- Samples collected and analyzed
  - State and local law enforcement and CDC involved
  - Presence of clenbuterol was identified
Clenbuterol Toxicity

- Tachycardia, hypotension
- Palpitations
- Vomiting
- Muscle spasm
- Hyperreflexia
- Hyperglycemia
- Hypokalemia

Treatment

- Supportive Care
- Admission if
  - Serious symptoms
  - Suicidal
Synthetic Cannabinoids

- Appeared on the Internet in 2006
- Agonize endogenous cannabinoid receptors
  - JWH-018, JWH-073, JWH-175, CP-47,497
  - CB₁ and CB₂ receptors
  - More potent than Δ⁹-tetrahydrocannabinol

- Many different products
- $25 - $40 per packet
  - More expensive than marijuana
### Synthetic Cannabinoids

- Ingredients listed as plant or herbal material
  - Accuracy unknown
  - Product dipped in or sprayed with synthetic cannabinoids
- Labeled, “not for human consumption”
  - Marketed as incense

### The Appeal

- Novelty
- “Legal” high
- Generally not detected on drug screen
Clinical Effects

- Hypokalemia
- Anxiety, Agitation
- Tachycardia
- Vomiting
- Xerostomia
- Psychosis, Paranoia, Hallucinations
- Seizures
- Possible withdrawal syndrome

Laboratory Evaluation

- Most products not detected on routine urine drugs of abuse screen
- Some companies report capability to detect JWH-018 and JWH-073 for up to 72 hours in urine
- Testing as dictated by clinical scenario
Treatment

- Supportive
- Benzodiazepines
  - Agitation
  - Tachycardia
  - Hypertension

Status

- DEA’s emergency scheduling authority used to temporarily classify 5 synthetic cannabinoids as Schedule I
  - November 24, 2010
  - JWH-018, JWH-073, JWH-200, CP-47,497 and cannabicyclohexanol
Summary

• Use of bath salts, khat, synthetic cannabinoids is currently illegal
• Replacement designer drugs already surfacing
• Toxicology screening not reliable
• Intoxication can be life threatening
• Withdrawal syndromes do exist

New Antidotes

Marcel J. Casavant, MD, FACEP, FACMT
Chief, Pharmacology/Toxicology
Nationwide Children’s Hospital
Medical Director, Central Ohio Poison Center
Clinical Professor,
The Ohio State University Colleges of
Medicine & Pharmacy
Objectives

- high dose insulin/euglycemia
- intravenous lipid infusion
- poison control center consultation

Antidote

1. noun, a substance which counteracts the effects of a toxicant
Drug Induced Cardiogenic Shock

- 35 y o woman overdosed on verapamil and propranolol in suicide attempt
- Unresponsive, BP 60/30, HR 70, RR 10, T 97
- Treatments:
  - intubation
  - IV fluid bolus x 2
  - atropine
  - calcium chloride x 4
  - glucagon bolus & infusion
dopamine

- BP 48/30: what’s next?

Options

- More fluids
- Add vasopressors & titrate upward
- More calcium
- Call Poison Control: 800-222-1222
- High-dose insulin / euglycemia
- Intravenous lipid infusion
- Invasive support measures
High-dose insulin / euglycemia

- Bolus: 1 Unit/kg regular human insulin IV
- Drip: 1 - 10 Unit/kg/hr
- Dextrose: D50 bolus then D10 drip
- Bedside blood glucose checks
- Watch K\(^+\), Mg\(^{++}\), phosphate

Holger et al, Clin Toxicol 2011

High-dose insulin: disclosure

FDA has approved neither this dosing regimen nor this indication
High-dose insulin: evidence

✓ In vitro Studies & Animal Studies
✓ Case Reports
✓ Case Series
✓ Reviews
✓ Expert Opinion
X Randomized or Controlled Trials

High Dose Insulin: effects

- Inotropy, improved contractility, improved relaxation
- Vasodilation & capillary bed recruitment
- Overall: improved cardiac output, perfusion
- Often: improved HR & BP

### High Dose Insulin: Side Effects

- Hypoglycemia
- Hypokalemia
- Hypophosphatemia
- Delays & Calculation Errors

### High Dose Insulin: Clinical Monitoring

- Mental status
- Skin warmth & color
- Pulses & capillary refill
- Urine output
- Cardiac output monitoring
- Vitals
## Case One: Outcome

- 35 y o F verapamil & propranolol OD
- Failing despite aggressive treatments
- Poison Control recommends HDI / E
- 30 minutes after bolus insulin: 94/54
- Vasopressors stopped
- Insulin infusion 28 hours 1 unit/kg/hr
- Full Recovery

## High Dose Insulin: Lab Monitoring

- Bedside [glucose]: Q 10 – 60 min
- [K+]: Q 1 – 4 hours
- Serum pH, lactate, phosphorus, Mg++
Vasopressors & HDI/E

- No evidence vasopressors work for drug-induced cardiogenic shock
- Higher insulin doses required with vasopressors
- Taper/stop vasopressors after HDI/E
- Use HDI/E before vasopressors

Drug Induced Cardiotoxicity

- 40 y o man in cardiac arrest after trigger points injections with bupivacaine
- Intubated, CPR in progress x 30 minutes
- Treatments:
  | intubation | epinephrine |
  | amiodarone | vasopressin |
  | defibrillation x multi |

- asystole: what’s next?
## Options

- Stop
- Call Poison Control: 800-222-1222
- High-dose insulin / euglycemia
- Intravenous lipid infusion
- Invasive support measures

### Intravenous Lipid 20% Infusion

- **Bolus:** 1.5 mL/kg
  - Repeat up to 3x for persistent shock
  - Continue repeat boluses if asystole
- **Infusion:** 0.25 - 0.5 mL/kg/min

Jamaty, Clin Toxicol 2010; Cave & Harvey, Acad Emerg Med 2009
IV lipid infusion: disclosure

FDA has approved neither this indication nor these doses

IV Lipid infusion: evidence

- In vitro Studies & Animal Studies
- Case Reports & Case Series
- Reviews & Expert Opinion
- Randomized or Controlled Trials
IV Lipid infusion: indications

- Life-threatening cardiotoxicity from
  - local anesthetics
  - haloperidol
  - tricyclic antidepressants
  - lipophilic beta blockers and calcium channel blockers
  - others
- CNS tox, seizure, coma from lipid-soluble drugs

Jamaty, Clin Toxicol 2010

IV Lipid Infusion: effects

- Lipid Sink: decreased free drug level
- Improve myocardial FFA uptake, use
- Improve myocardial Ca++

Jamaty, Clin Toxicol 2010; Cave & Harvey, Acad Emerg Med 2009
IV Lipid Infusion: Side Effects

- Hyperamylasemia
- Respiratory distress syndrome
- Hematuria

- Multi complications associated with TPN: not (yet) reported in rescue therapy

Cave, Crit Care Med 2011; Mirtallo et al, Annals Pharmacother 2010;
Cave, Emerg Med Australas 2011

---

IV Lipid Infusion: Monitoring

Vitals & Perfusion

Cave, Crit Care Med 2011; Mirtallo et al, Annals Pharmacother 2010;
Cave, Emerg Med Australas 2011
Case Two: Outcome

40 y o man, bupivacaine → cardiac arrest
45 min CPR → asystole
1.5 mL/kg 20% intravenous lipid → return of spontaneous circulation in 2 minutes
# Conclusions

- High-dose insulin / euglycemia for drug-induced cardiogenic shock: can use early, and perhaps instead of vasopressors

- Intravenous Lipid Infusion for cardiotoxicity from selected drugs: can use before arrest

- Poison Control can help: 800-222-1222
