Preventive Cardiology

Beyond Statins for Cardiovascular Risk Reduction

M. Wesley Milks, MD, FACC
Assistant Professor of Clinical Medicine
Division of Cardiovascular Medicine
Department of Internal Medicine
The Ohio State University Wexner Medical Center

Introduction

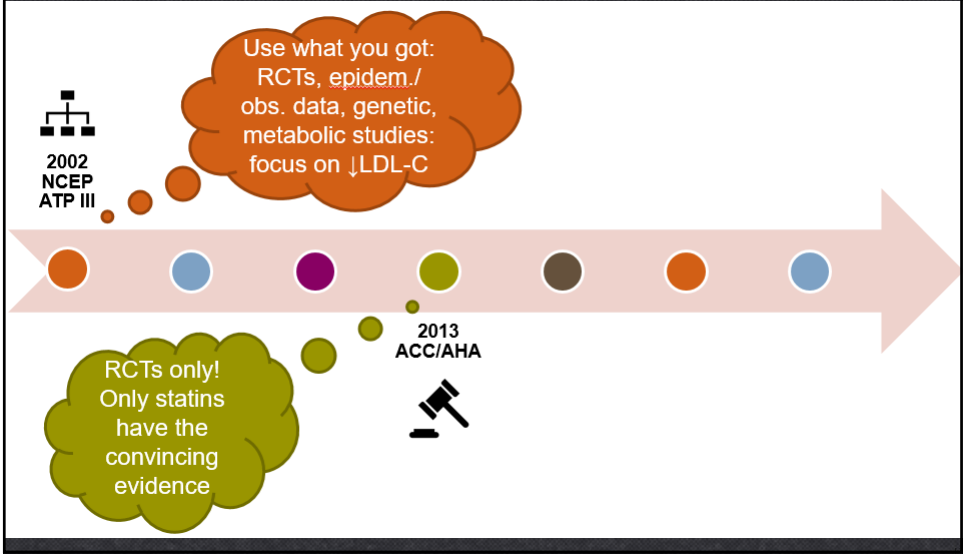
- Objectives
  1. Identify clinical scenarios in which statins and/or non-statin lipid lowering treatments are indicated
  2. Describe the mechanism of action of and indications for PCSK9 inhibitors, SGLT2 inhibitors, and high dose omega-3-polyunsaturated fatty acids

- No competing interests /financial relationships to disclose
- I will discuss what is currently off-label use of icosapent ethyl (Vascepa®)
- Branded Rx/OTC products shown: not an endorsement

Outline

- Recent history of and important concepts in clinical lipidology
- New ACC/AHA Blood Cholesterol guidelines: goals are back
- PCSK9 inhibition: when and how?
- SGLT2 inhibition: inducing glycosuria improves outcomes
- Marine omega-3 polyunsaturated fatty acids: fishy or not?
- Other "nutraceuticals": is there a role?

Recent History of Preventive Cardiology



2013 ACC/AHA Guidelines

Step 1: Decide whether there is an indication for a statin
Next steps: unclear

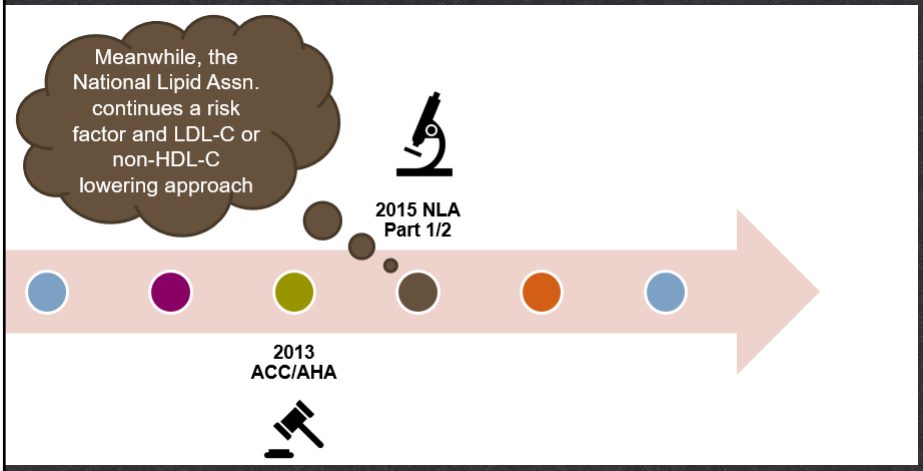
- **Is there a goal LDL-C to achieve?**
- **What is the role of non-statins?**
- **The LDL "hypothesis": to what extent does non-statin LDL-C lowering reduce risk?**

Statin Benefit Groups			
Clinical **ASCVD**	LDL-C≥ 190 mg/dl	**DM**, LDL-C 70-189 mg/dl, age 40-75	Primary prev. (10-yr risk ≥ 7.5%)

All roads lead to STATIN

Stone NJ, et al. 2013 ACC/AHA Blood Cholesterol Guideline. *JACC* 2014;63(25):2889-934.

Recent History of Preventive Cardiology



Treatment algorithm: NLA Part 1 / Part 2 (2015)

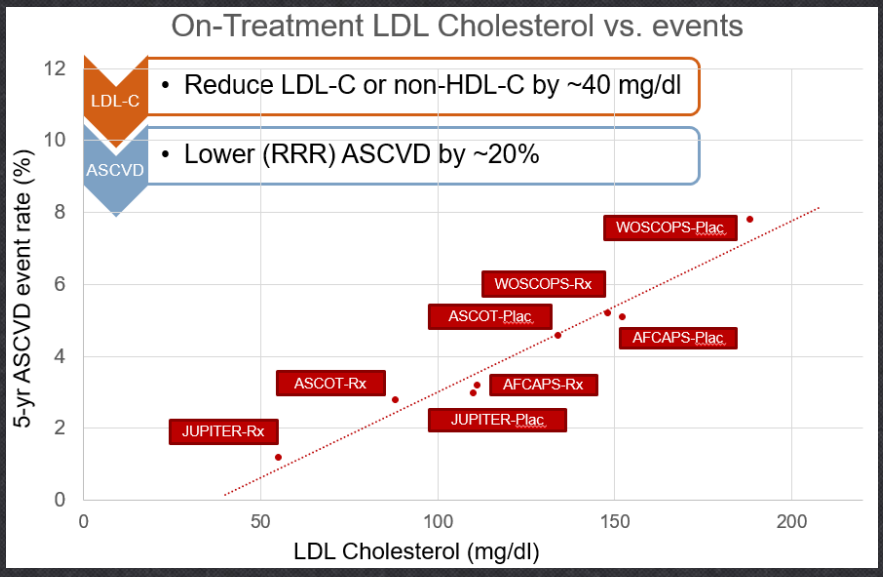
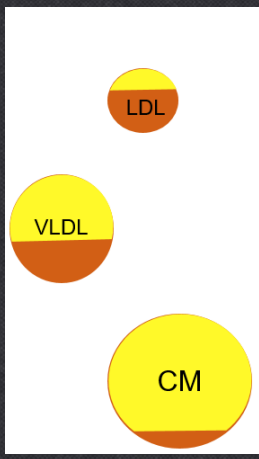
NLA Part 1 / Part 2 (2015)



Jacobson TA, Ito MK, Maki KC, et al. *J Clin Lipidology* 2015;9:129-169.

LDL-C vs. Non-HDL-C

C TG



Lipoprotein	Cholesterol (approx. % of lipid content)	Triglyceride (approx. % of lipid content)
LDL	70	30
VLDL or Chylomicron remnant	20	80
Chylomicron	5	95

Walker HK, Hall WD, Hurst JW, eds. Chapter 31, Cholesterol, Triglycerides, and Associated Lipoproteins. Butterworths 1990.

LDL-C vs. Non-HDL-C

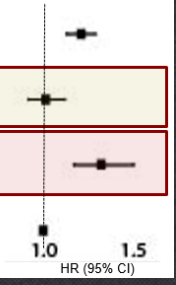
- **We live in an LDL-C paradigm. Why?** C TG

Diagnosis → ↓ Lipids (mg/dl)	Normal	Familial Hyperchol.	Metabolic Syndrome / DM
Total-C	158	342	318
HDL-C	59	49	23
LDL-C	88	**280**	?
Triglycerides	53	67	**1,621**
Non-HDL-C	99	293	295
Depiction LDL VLDL / CM remn.			
Walker HK, Hall WD, Hurst JW, eds. Chapter 31, Cholesterol, Triglycerides, and Associated Lipoproteins. Butterworths 1990.

LDL-C vs. Non-HDL-C

- We live in an LDL-C paradigm. Why?

LDL-C	Non-HDL-C	N (MACE)	N (Total)	HR (95% CI)
≥ 100 mg/dl	≥ 130 mg/dl	1,877	10,419	1.21 (1.13-1.29)
≥ 100 mg/dl	< 130 mg/dl	467	2,873	1.02 (0.92-1.12)
< 100 mg/dl	≥ 130 mg/dl	283	1,435	1.32 (1.17-1.50)
< 100 mg/dl	< 130 mg/dl	2,760	23,426	1.00 (Reference)



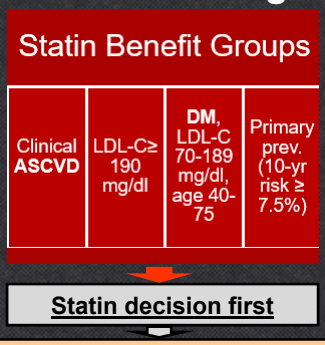
- Statin-treated patients who reached goals of LDL-C, non-HDL-C, both, or neither
- When discordant, non-HDL-C predicts major CV events better than LDL-C
- HRs adjusted for sex, age, smoking, DM, SBP, and trial

Boekholdt SM, Arsenault BJ, Mora S, et al. *JAMA*. 2012;307:1302–1309
Cited in Jacobson TA, Ito MK, Maki KC, et al. *J Clin Lipidology* 2015;9:129-169.

2016-2017 ACC Expert Consensus

- Role of non-statin therapies for LDL-C lowering in management of ASCVD risk

Step 1: Decide whether there is an indication for a statin
Step 2: Consider non-statin therapies
Step 3: Recognize non-statin indications



- Consider adherence, statin tolerance, control of risk factors
- Consider percentage LDL-C & non-HDL-C reduction and level achieved
- Consider ezetimibe, bile acid sequestrants, PCSK9i

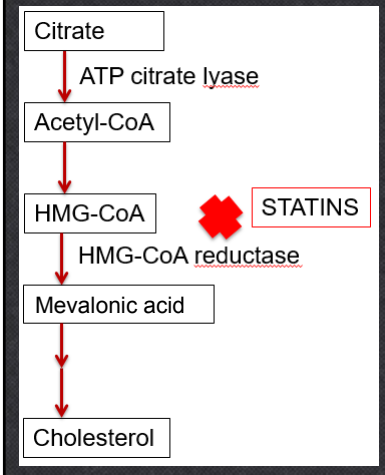
Lloyd-Jones DM, et al. *J Am Coll Cardiol.* 2017 Oct 3;70(14):1785-1822.

Preventive Cardiology

Beyond Statins for Cardiovascular Risk Reduction

Kelly M. Bartsch, PharmD, BCPS, CLS
Specialty Practice Pharmacist - Ambulatory Care
The Ohio State University Wexner Medical Center

Statins



- **Dosing + Effects:**
  - **Potency varies by statin and dose**
    - **High intensity: >50% ↓LDL-C**
    - **May also decrease TRG and HDL**
  - **PO formulations**
  - **Once daily administration***
  - **Newer agents can be taken at any time of day**
- **Pleiotropic effects**
- **Adverse Effects:**
  - **Myalgias, GI upset**
- **Drug interactions**

*exception: fluvastatin

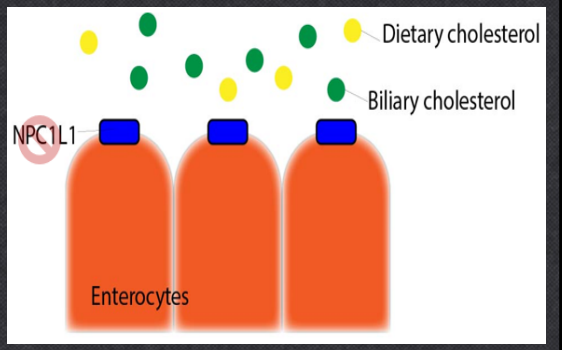
Rosuvastatin [package insert]/ AstraZeneca. Wilmington, DE. 11/2018. Graphic original.

Statins – Potency + Lipophilicity

Intensity:	Lova-	Prava-	Simva-	Fluva-	Pitava-	Atorva-	Rosuvastatin
Low	20mg	20mg	10mg	40mg	1mg		
Mod.	40mg	40mg	20mg	80mg	2mg	10mg	5mg
	80mg	80mg	40mg		4mg	20mg	10mg
High			(80mg)			40mg	20mg
						80mg	40mg

Ezetimibe

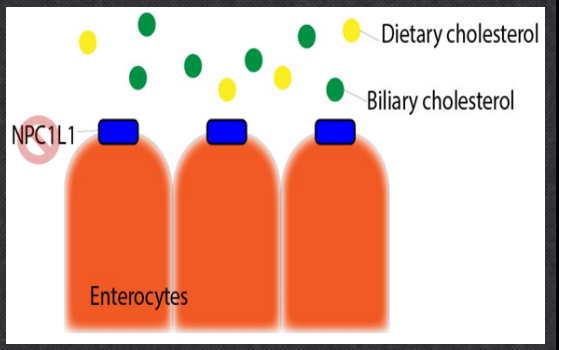
- **Mechanism**
  - **Blocks NPC1L1**
  - **Inhibits enteric cholesterol absorption**
  - **(Statins increase chol. absorption)**
- **Dosing & effect**
  - **10 mg PO daily**
  - **Expect 15-25% ↓LDL-C**



Drug information: "Ezetimibe." Drug Monograph. Gold Standard. Published August 1, 2017. Graphic original.

Ezetimibe

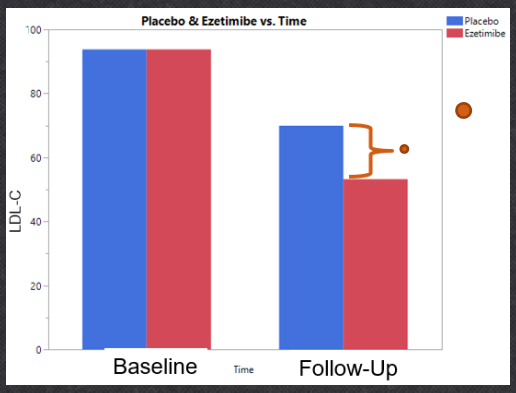
- Adverse effects
  - Respiratory tract symptoms (4% vs. 2% placebo)
  - Transaminase elevations with statins (1-2%)
  - GI symptoms comparable to placebo Dosing & effect



Drug information: "Ezetimibe." Drug Monograph. Gold Standard. Published August 1, 2017. Graphic original.

IMPROVE-IT

- Outcomes from non-statin driven LDL-C reduction



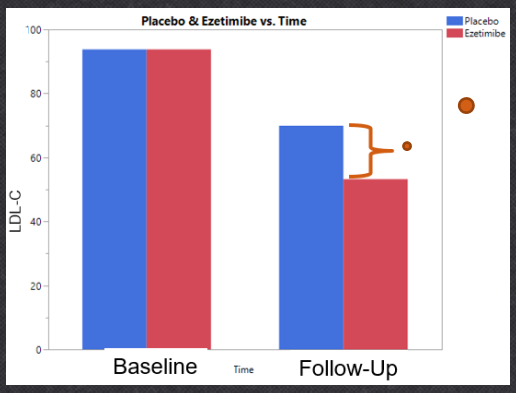
24% additional LDL-C reduction

- 18,144 patients with acute coronary syndrome
- LDL-C at baseline: 50 to 125 mg/dl
- Randomization: simvastatin 40 mg + [ezetimibe 10 mg OR placebo]

Cannon CP, et al. *New Engl J Med* 2015;372(25).

IMPROVE-IT

- Outcomes from non-statin driven LDL-C reduction



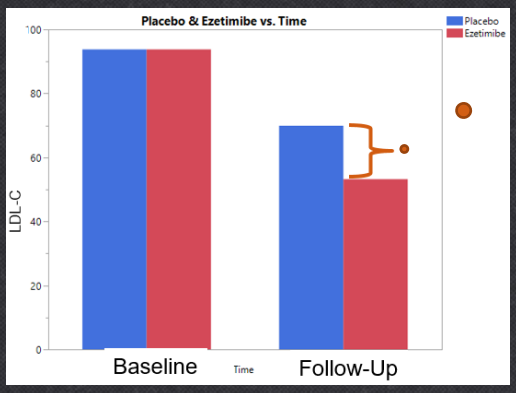
24% additional LDL-C reduction

- Primary end point composite: cardiovascular death, nonfatal MI, UA requiring hospitalization, coronary revascularization (≥ 30 d after randomization), nonfatal CVA

Cannon CP, et al. *New Engl J Med* 2015;372(25).

IMPROVE-IT

- Outcomes from non-statin driven LDL-C reduction



24% additional LDL-C reduction

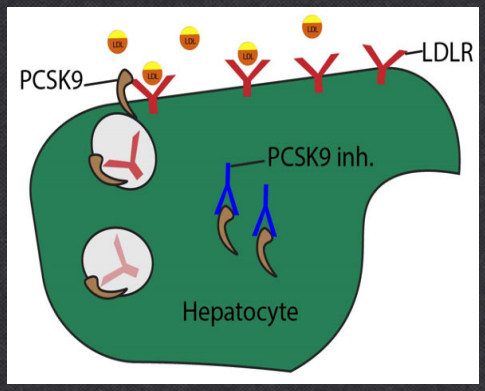
- Median follow up 6 years
- Outcome: HR 0.936 (95% CI 0.89-0.99)

Cannon CP, et al. *New Engl J Med* 2015;372(25).

PCSK9 inhibitors

***Mechanism**, dosing, and adverse effects*

- Mechanism
  - Human IgG1/2 mAb that inhibits proprotein convertase subtilisin/kexin type 9 binding to LDLR
  - $T_{1/2}$ 17-20 days (alirocumab) or 11-17 (evolocumab) days

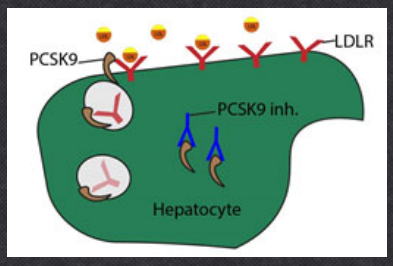


Drug information: "Alirocumb." Drug Monograph. Gold Standard. Published November 14, 2018.
Drug information: "Evolocumab. " Drug Monograph. Gold Standard. Published October 23, 2018.
Graphic original

PCSK9 inhibitors

***Mechanism**, dosing, and adverse effects*

- Dosing & effect
  - Alirocumab: 75-150 mg SQ q2wk, OR 300 mg SQ q4wk
  - Evolocumab: 140 mg SQ q2wk or 420 mg SQ q4wk
  - Expect **50-70% additional ↓LDL-C**

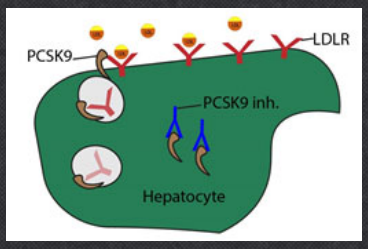


Drug information: "Alirocumb." Drug Monograph. Gold Standard. Published November 14, 2018.
Drug information: "Evolocumab. " Drug Monograph. Gold Standard. Published October 23, 2018.
Graphic original

PCSK9 inhibitors

***Mechanism**, dosing, and adverse effects*

- Adverse effects
  - Injection site reactions (7% vs. 5% placebo)
  - Nasopharyngitis, flu-like reaction, myalgias, new onset DM similar to placebo
  - Antibody formation
  - Rare serious allergic reactions



Drug information: "Alirocumb." Drug Monograph. Gold Standard. Published November 14, 2018.
Drug information: "Evolocumab. " Drug Monograph. Gold Standard. Published October 23, 2018.
Graphic original

PCSK9 inhibitors

FOURIER: Outcomes from non-statin driven LDL-C reduction

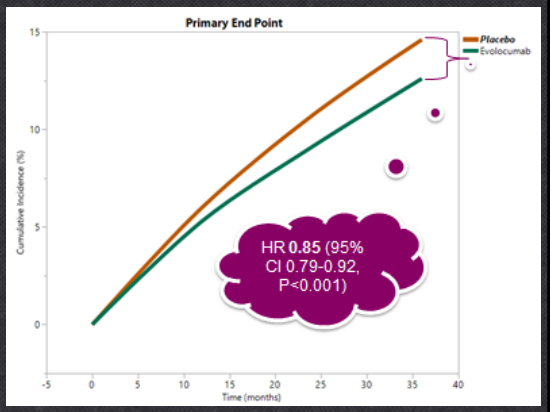
- Enrollment: 27,564 patients with ASCVD, LDL-C ≥ 70 mg/dl receiving statin therapy
- Treatment: evolocumab 140 mg q2wk or 420 mg q4wk vs. placebo
- Outcome: [CV death, MI, CVA, hospitalization for UA, coronary revascularization]
- Follow up: median 2.2 years

Sabatine MS, Giugliano RP, Keech AC, et al. *New Engl J Med* 2017 May 4;376(18):1713-1722.

PCSK9 inhibitors

FOURIER: Outcomes from non-statin driven LDL-C reduction

- **Outcome: [CV death, MI, CVA, hospitalization for UA, cor. revasc.]**
- **Follow up: median 2.2 years**

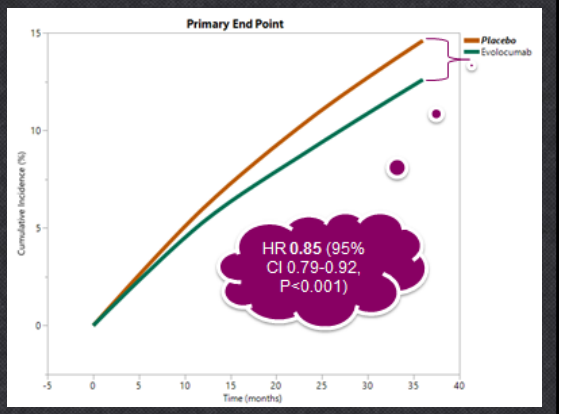


Sabatine MS, Giugliano RP, Keech AC, et al. *New Engl J Med* 2017 May 4;376(18):1713-1722.

PCSK9 inhibitors

FOURIER: Outcomes from non-statin driven LDL-C reduction

- **Adverse events: no significant difference (incl. new DM, neurocognitive events) except injection site reactions (2.1% vs. 1.6% placebo)**



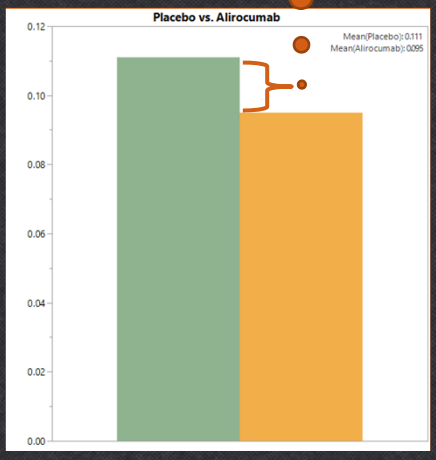
Sabatine MS, Giugliano RP, Keech AC, et al. *New Engl J Med* 2017 May 4;376(18):1713-1722.

PCSK9 inhibitors

HR 0.85 (95% CI 0.78-0.93, P<0.001)

ODYSSEY OUTCOMES: Outcomes from non-statin driven LDL-C reduction

- Enrollment: 18,924 patients with acute coronary syndrome
- Uncontrolled cholesterol: LDL-C ≥ 70 or non-HDL-C ≥ 100 mg/dl on high-intensity or maximum-tolerated statin



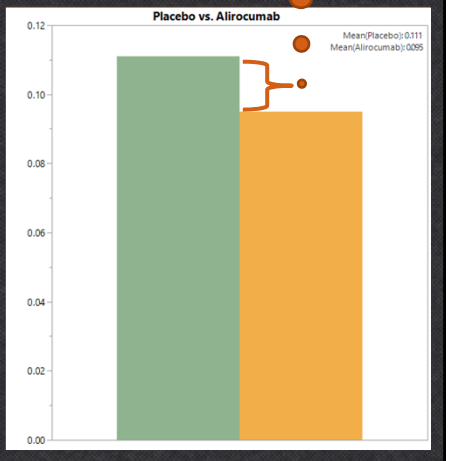
Schwartz GG, et al. *N Engl J Med.* 2018 Nov 29;379(22):2097-2107.

PCSK9 inhibitors

HR 0.85 (95% CI 0.78-0.93, P<0.001)

ODYSSEY OUTCOMES: Outcomes from non-statin driven LDL-C reduction

- Treatment: alirocumab vs. placebo (targeted LDL-C 25 to 50 mg/dl)
- Outcome: [CHD death, nonfatal MI, ischemic CVA, UA req. hospitalization]
- Follow-up median 2.8 years



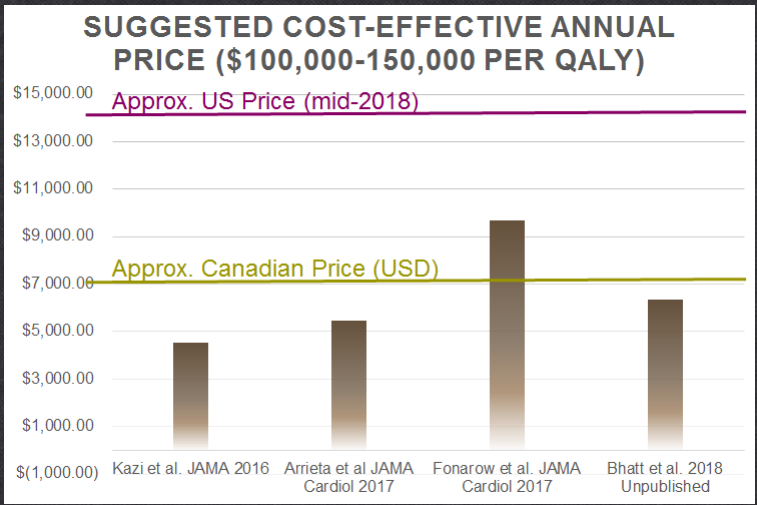
Schwartz GG, et al. *N Engl J Med.* 2018 Nov 29;379(22):2097-2107.

PCSK9 inhibitors

Outcomes from non-statin driven LDL-C reduction

	FOURIER	ODYSSEY OUTCOMES
Primary endpoint (composite)	CV death, MI, stroke, hospitalization for unstable angina, or cor. revascularization	CHD death, non-fatal MI, fatal or non-fatal ischemic stroke, or UA requiring hospitalization
Treatment vs. placebo	9.8% vs. 11.3%	9.5% vs. 11.1%
Median follow up	2.2 years	2.8 years
HR	0.85	0.85
NNT	67	64

PCSK9 inhibitors: what about cost?



Preventive Cardiology

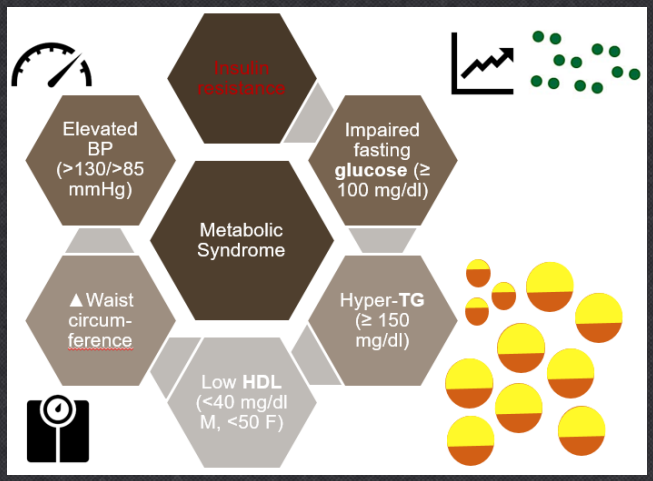
Outline

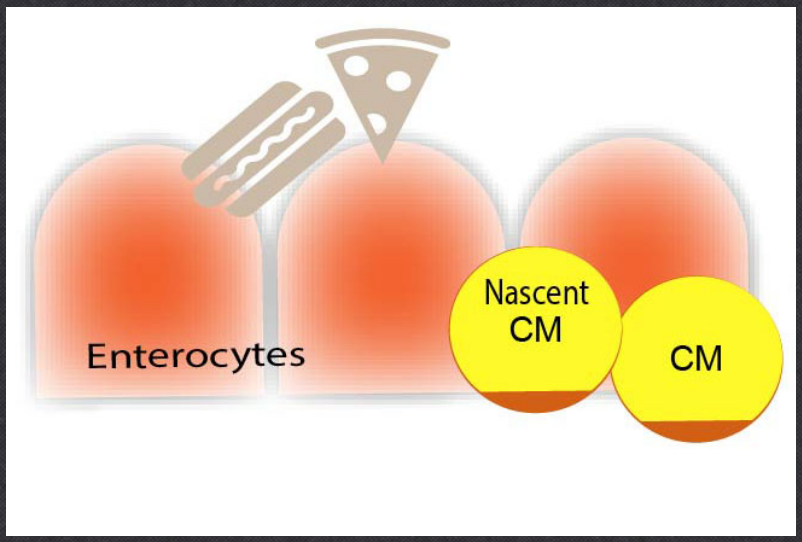
- Recent history of and important concepts in clinical lipidology
- New ACC/AHA Blood Cholesterol guidelines: goals are back
- PCSK9 inhibition: when and how?
- SGLT2 inhibition: inducing glycosuria improves outcomes
- Marine omega-3 polyunsaturated fatty acids: fishy or not?
- Other "nutraceuticals": is there a role?

Metabolic syndrome and diabetes mellitus

- **Metabolic syndrome: co-occurrence of cardiovascular risk factors**
- **Share mechanisms of type 2 diabetes mellitus**

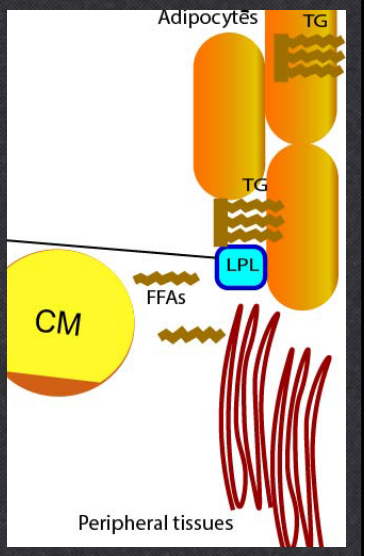


Huang PL. *Dis Model Mech* 2009. Graphics original.

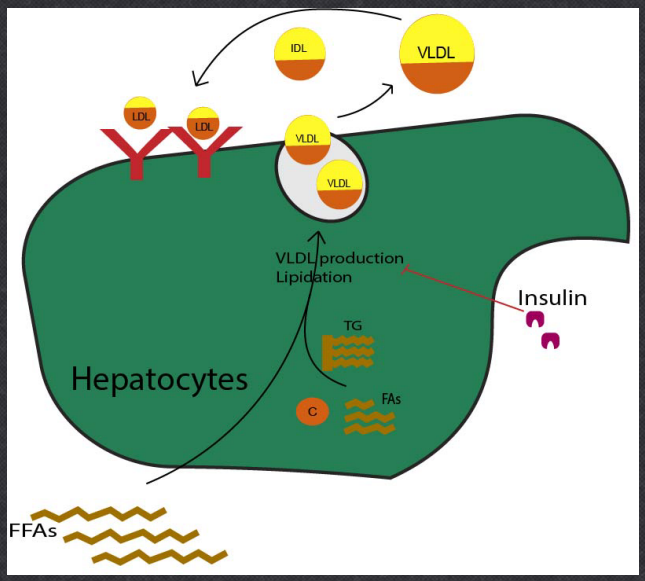


- Chapter 35: Special Patient Populations: Diabetes and Metabolic Syndrome. Clinical Lipidology. Ballantyne, ed. Elsevier.
- Filippas-Ntekouan. *Exp Op Drug Metab & Tox* 2018;14(11):1113-1121.
- Graphic original.

- **Hormone sensitive lipase (HSL)** mobilizes stored fat, breaking down TGs, freeing FAs
- **More** energy in bloodstream
- **HSL is inhibited by insulin**
  - Lipoprotein lipase (LPL) cleaves TGs into free fatty acids (FFAs)
  - "Clears" TG-rich particles from the circulation
  - **Less** energy in bloodstream
  - **LPL is activated by insulin**

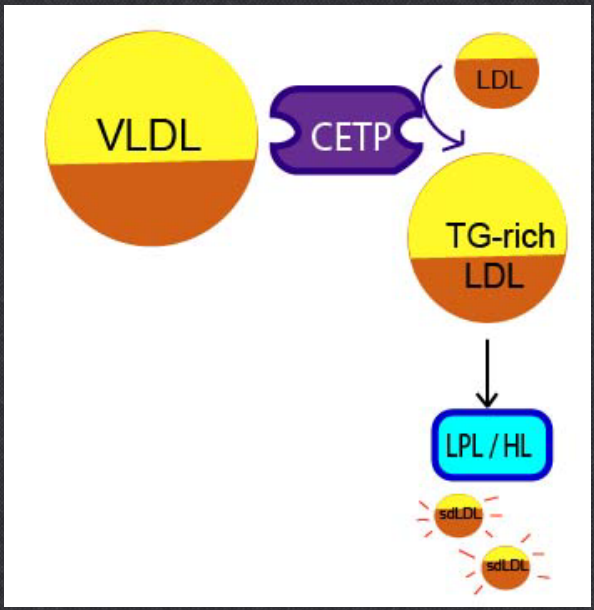


- Chapter 35: Special Patient Populations: Diabetes and Metabolic Syndrome. Clinical Lipidology. Ballantyne, ed. Elsevier.
- Filippas-Ntekouan. *Exp Op Drug Metab & Tox* 2018;14(11):1113-1121.
- Graphic original.



- **Hepatic VLDL production also occurs when increased circulating energy stores are needed**
- **VLDL production is inhibited by insulin**

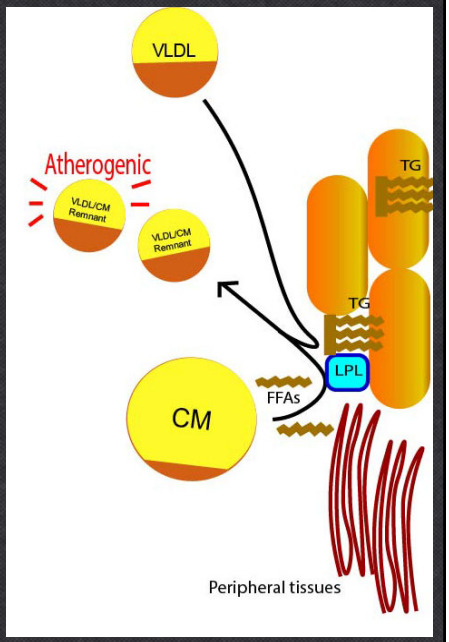
- Chapter 35: Special Patient Populations: Diabetes and Metabolic Syndrome. Clinical Lipidology. Ballantyne, ed. Elsevier.
- Filippas-Ntekouan. *Exp Op Drug Metab & Tox* 2018;14(11):1113-1121.
- Graphic original.



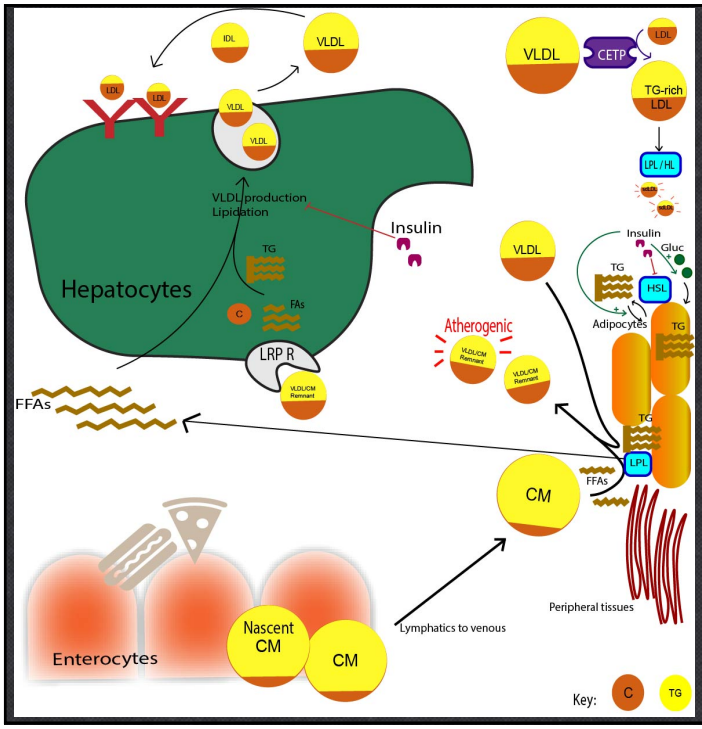
- VLDL can transfer its TG content to LDL
- TG-rich LDL is preferentially converted to **small, dense LDL** which is particularly **atherogenic**

- Chapter 35: Special Patient Populations: Diabetes and Metabolic Syndrome. Clinical Lipidology. Ballantyne, ed. Elsevier.
- Filippas-Ntekouan. *Exp Op Drug Metab & Tox* 2018;14(11):1113-1121.
- Graphic original.

- After VLDL and chylomicrons (CM) donate their lipid contents to end-tissues, they become VLDL or CM remnants
- Remnants are particularly **atherogenic**



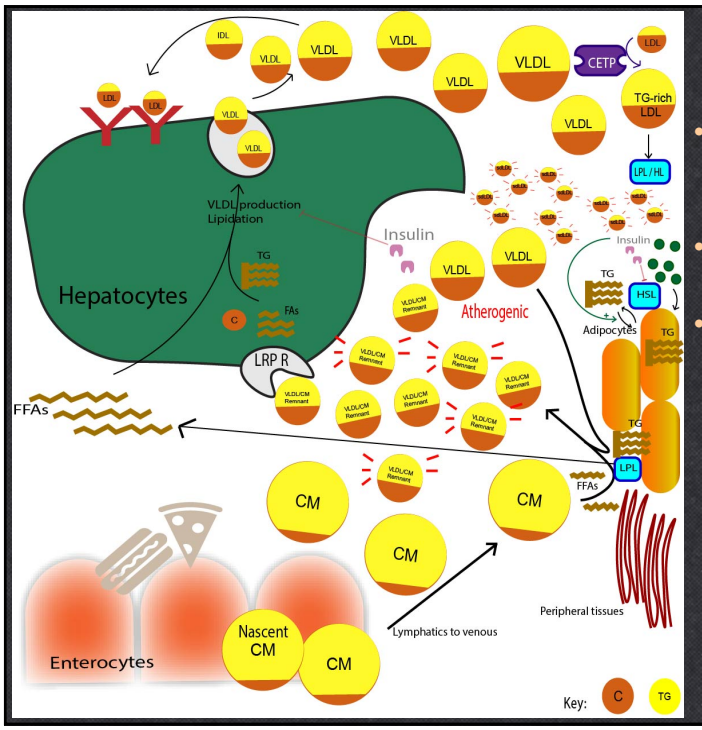
- Chapter 35: Special Patient Populations: Diabetes and Metabolic Syndrome. Clinical Lipidology. Ballantyne, ed. Elsevier.
- Filippas-Ntekouan. *Exp Op Drug Metab & Tox* 2018;14(11):1113-1121.
- Graphic original.



Normal state

- Circulating VLDLs and CMs are kept to a minimum
- Energy is "cleared appropriately" from the bloodstream for utilization or storage

- Chapter 35: Special Patient Populations: Diabetes and Metabolic Syndrome. Clinical Lipidology. Ballantyne, ed. Elsevier.
- Filippas-Ntekouan. *Exp Op Drug Metab & Tox* 2018;14(11):1113-1121.
- Graphic original.



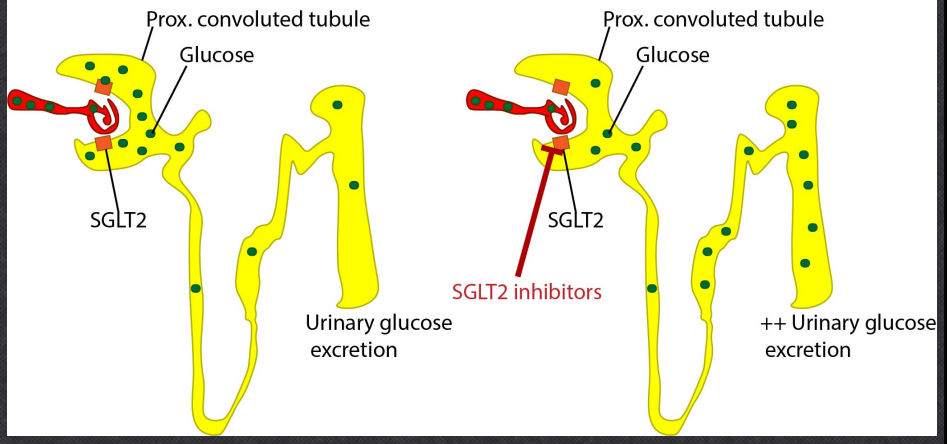
Diabetic dyslipidemia

- Increased serum **triglycerides**
- Decreased HDL-C
- Predominance of small dense **LDL particles and VLDL/CM remnants**

- Chapter 35: Special Patient Populations: Diabetes and Metabolic Syndrome. Clinical Lipidology. Ballantyne, ed. Elsevier.
- Filippas-Ntekouan. *Exp Op Drug Metab & Tox* 2018;14(11):1113-1121.
- Graphic original.

SGLT2 inhibitors

- Therapeutic glycosuria



SGLT2 inhibitors

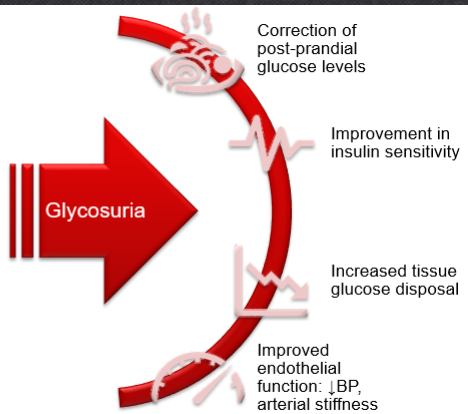
- Class currently includes canagliflozin, dapagliflozin, and empagliflozin
- Mechanism
  - Prevent reabsorption of glucose by the kidneys
  - Net decrease in blood sugar
- Dosing & effect
  - Oral agents with daily dosing
  - A1c lowering of 0.5-0.8%
- Adverse effects
    - Hypotension
    - Urinary tract infections
    - Ketoacidosis
    - AKI

Canagliflozin [package insert]. Janssen Pharmaceuticals, Inc. Titusville, NJ. 2013.

SGLT2 inhibitors

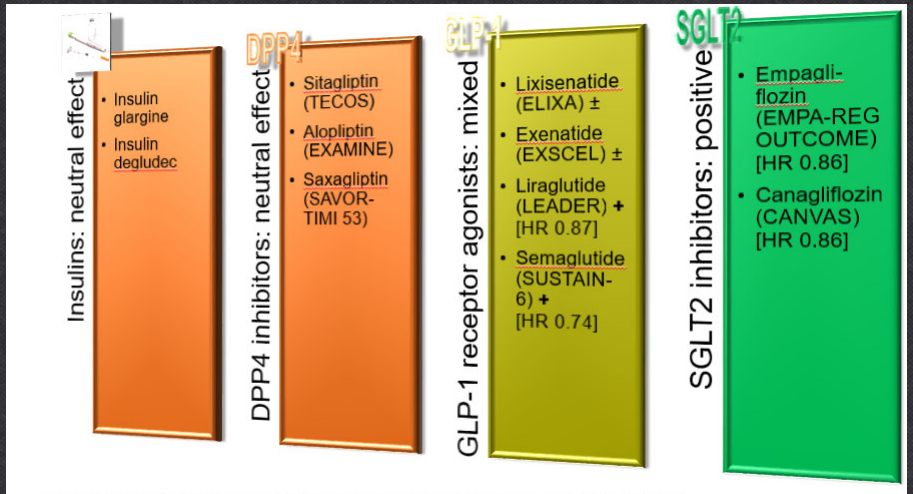
- **Therapeutic glycosuria**

Parameter	Approximate effect of SGLT2 inhibitor treatment
Body weight	↓ 4 kg
Visceral adipose tissue mass	↓ 8%
Triglycerides	↓ 4%
HDL-C	↑ 6%
LDL-C	↑ 2%



Inzucchi SE et al. *Diab & Vasc Dis Res* 2015;12(2):90-100.

Summary of CV benefit/harm of diabetic drugs



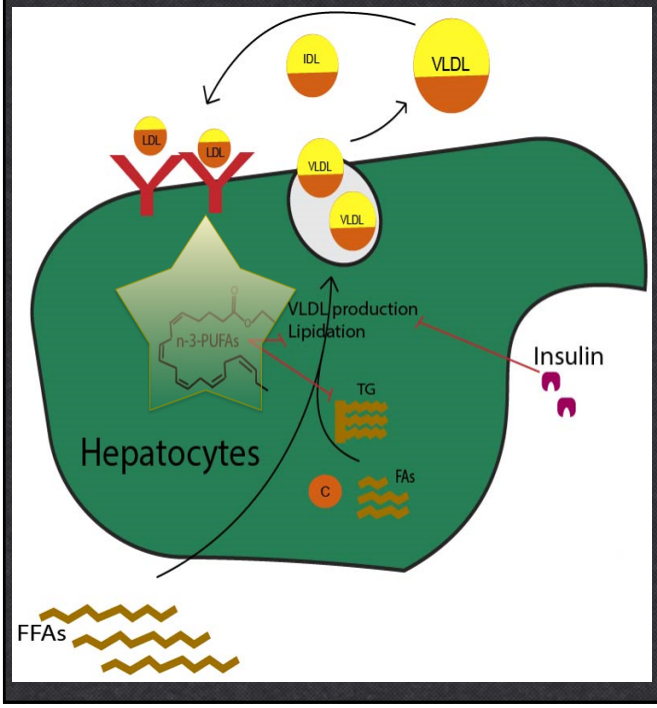
- Agent (STUDY example) [HR for generally primary endpoint of MACE, p<0.05]

Cefalu WT et al. *Diab Care* 2018;41:14-31.

See Dr. Joshua Joseph's MedNet21 webcast for more information

Outline

- Recent history of and important concepts in clinical lipidology
- New ACC/AHA Blood Cholesterol guidelines: goals are back
- PCSK9 inhibition: when and how?
- SGLT2 inhibition: inducing glycosuria improves outcomes
- **Marine omega-3 polyunsaturated fatty acids: fishy or not?**
- Other "nutraceuticals": **is there a role?**

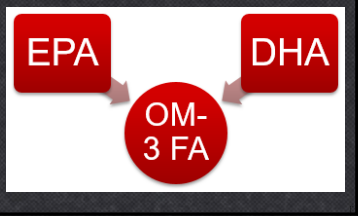


- Recall: regulation of VLDL synthesis is under the control of insulin
- Also: **ω-3-poly-unsaturated fatty acids (ω-3-PUFAs)** inhibit VLDL lipidation and TG production

- Chapter 35: Special Patient Populations: Diabetes and Metabolic Syndrome. Clinical Lipidology. Ballantyne, ed. Elsevier.
- Filippas-Ntekouan. *Exp Op Drug Metab & Tox* 2018;14(11):1113-1121.
- Graphic original.

Omega-3 Fatty Acids

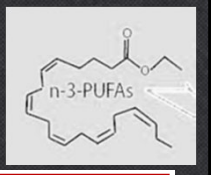
- Mechanism of action – not well elucidated
  - Proposed: increased beta oxidation, inhibition of acyl-CoA, decreased hepatic production of VLDL, increased LPL activity
- Dosing & effect
  - For TG >500: dosed at 2g twice daily
  - Primary effect is to lower TG
    - DHA component can increase LDL
- Adverse effects
  - Prolongation of bleeding time
  - Fishy aftertaste or belching
  - Nausea



Vascepa [package insert]. Amarin Pharma Inc. Bedminster, NJ. 2012.

ω-3-poly-unsaturated fatty acids

DHA 22:6
EPA 20:5



- Do they reduce serum triglycerides?
  - Yes
- Do they change outcomes?

Parameter	Approximate effect of ω-3-PUFA treatment
Non-HDL-C	↓ 5-14%
Triglycerides	↓ **19-44%**
HDL-C	±
LDL-C	↓6%-↑25%

Jacobson TA, Ito MK, Maki KC, et al. *J Clin Lipidology* 2015;9:129-169.

ω-3-poly-unsaturated fatty acids

Does treatment change outcomes?

Trial	Endpoints / Mean Follow-up	Daily dose	Outcome
Meta-analysis of 10 trials Aung et al. *JAMA Cardiol* 2018 (n=77,917) prior CHD, CVA, or high ASCVD risk	Any CHD (fatal/nonfatal) or major vascular events 4.4 years	Generally **1 g** EPA/DHA	**No effect**
GISSI-Prevenzione investigators *Lancet* 1999; (n=11,324) with recent MI (2x2 design also with vit. E)	Death, non-fatal MI, CVA 3.5 years	**1 g** EPA/DHA vs. Placebo	**Benefit** Composite RRR 10% Death RRR 14%
JELIS Yokogama et al. *Lancet* 2007 (n=18,645) unselected hypercholesterolemic (Total-C > 252 mg/dl) Japanese patients	Any CHD event (CHD death, SCD, fatal/nonfatal MI, UA, PCI, CABG) 4.6 years	Statin + [**1.8 g EPA-only** or placebo]	**Benefit** Composite RRR 19% No difference in LDL

REDUCE-IT

- **Enrollment: 8,179 patients with hypertriglyceridemia (135-499 mg/dl) and "controlled" LDL (41-100 mg/dl).**
- **Patients were (mean) 64 yrs, 71% male, BMI 30.8, most on statins**
- **Endpoint: [CV death, nonfatal MI, nonfatal CVA, coronary revascularization or UA]**
- **Treatment: icosapent ethyl (EPA only) 4 g/day (2 g bid with food) vs. placebo (mineral oil)**
- **Follow-up: 4.9 yrs.**

Parameter	Treatment (EPA)	Placebo
Triglycerides	↓18.3% (-39 mg/dl)	↑2.2% (+4.5 mg/dl)
LDL-C	↑3.1% (+2.0 mg/dl)	↑10.2% (+7.0 mg/dl)

HR 0.75
NNT 21
(RRR 20% for CV death)

Bhatt DL, et al. *N Engl J Med.* 2019 Jan 3;380(1):11-22

REDUCE-IT

What's the catch?

- Any adverse effects?
  - No difference in bleeding, including hemorrhagic stroke
  - Hospitalization for atrial fibrillation or flutter was 3.1% in EPA group vs. 2.1% placebo (p=0.0004).
- Is it just the triglyceride lowering?
  - ACCORD-Lipid: fenofibrate lowers TG but no change in outcome
  - AIM-HIGH, HPS2-THRIVE: niacin lowers TG but no change in outcome
- Will REDUCE-IT change practice?

Bhatt DL, et al. *N Engl J Med.* 2019 Jan 3;380(1):11-22

ω-3-poly-unsaturated fatty acids

- Antiarrhythmic or not?

Trial	Dose	Outcomes
REDUCE-IT 2019	4 g/d **EPA only**	↑47% excess atrial fib/flutter
Cochrane Review 2018 79 RCTs, (n=112,059)	Varies (0.5 to >5 g/d)	Marine: No difference arrhythmia Plant-based (ALA): ↓21% arrhythmias
GISSI-HF (n=6,975) with HF	1 g/d mixed	No difference in atrial fibrillation ↓9% mortality; ↓8% HF admissions

- Animal studies suggest DHA may have antiarrhythmic properties in AF

Bhatt et al. *New Engl J Med* 2019;380(1):11-22.
Abdelhamid et al. *Cochrane Database Syst Rev* 2018;11:CD003177.
Aleksova et al. *Eur J Heart Fail* 2013;15(11):1289-95.
Tavazzi et al. *Lancet* 2008;372(9645):1223-30.
Ninio et al. *J Cardiovasc Electrophysiol* 2005 16:1189-1194.

ω-3-poly-unsaturated fatty acids

- **Current Rx products and labeling**

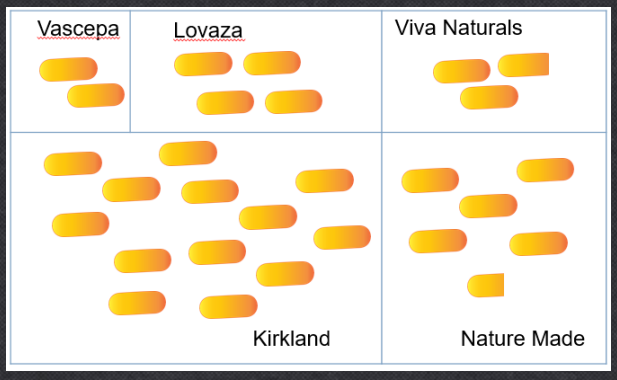
Agent	Trade Name Composition	Dose	Labeled Indication
Icosapent ethyl	Vascepa®	2 g bid **with food**	• Significant hypertriglyceridemia (>500 mg/dl) as adjunct to diet and exercise
ω-3 acid ethyl esters	Lovaza® 55% EPA / 45% DHA	4 g qd or 2 g bid +/- food	• Significant hypertriglyceridemia (>500 mg/dl) as adjunct to diet and exercise • For use as adjunct to simvastatin for hyper-TG
ω-3 carboxylic acids	Epanova® Mostly EPA	2-4 g qd +/- food	• Significant hypertriglyceridemia (>500 mg/dl) as adjunct to diet and exercise

Source: Drug Monographs. Gold Standard. Accessed 20 Jan 2019.

ω-3-poly-unsaturated fatty acids

- **Should I just buy OTC fish oil at the drug store?**

How to get 2 g EPA



700 mg EPA
240 mg DHA

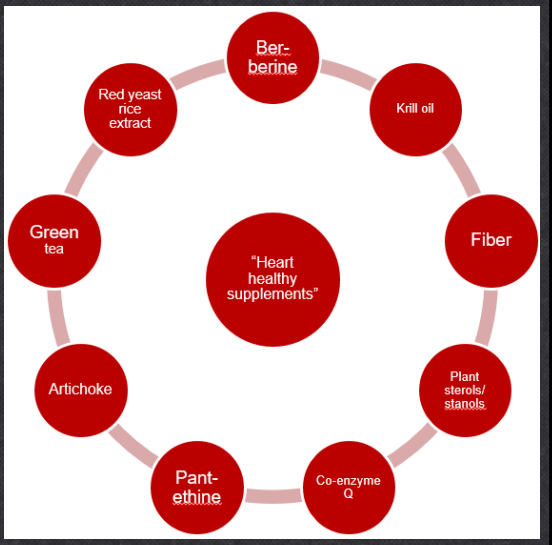
250 "omega-3"
?150 mg EPA
?100 mg DHA

360 mg EPA
300 mg DHA

"Nutraceuticals"

"Doc, is it OK if I take…?"

- ***"Certain nutraceuticals…alone or in combination with each other, as well as ezetimibe, might be considered as an alternative or add-on therapy to statins, although there is still insufficient evidence available with respect to long-term safety and effectiveness …."***



Banach et al. *J Am Coll Cardiol* 2018;72:96-118.

"Nutraceuticals" and lifestyle changes

Highlights

Intervention	Mechanism of action	Dose	Expected Δ LDL-C (relative)
Increased physical activity	Multifactorial	200-300 min/week	↓~5%
Loss of body weight	Multifactorial	↓5% body weight	↓3-5%
Diet low in saturated and trans fats	↓LDL-C production		↓5-10%
Viscous fiber	Bile acid sequestration, ↑satiety	5-10 g/day	↓5-20%
Plant sterols/stanols	Competitive inhibition of cholesterol absorption	2 g/day	↓~10%

"Nutraceuticals" and lifestyle changes

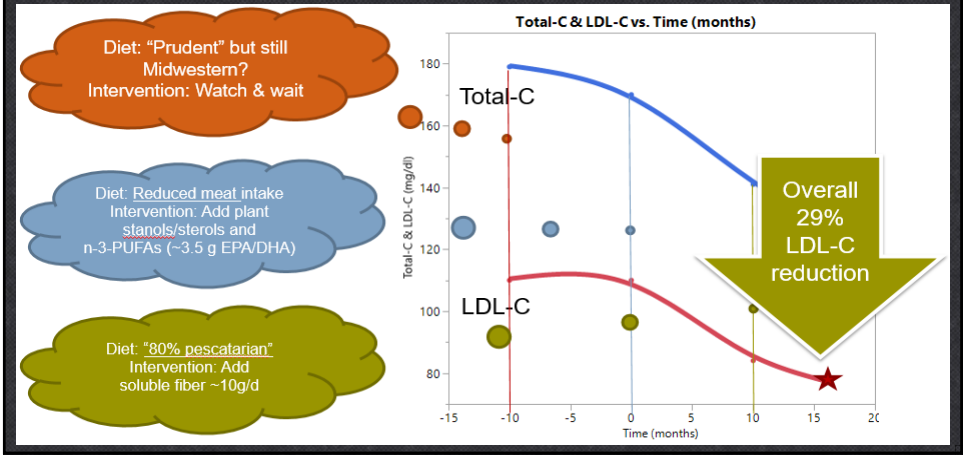
Highlights

Agent	Mechanism of action	Dose	Δ LDL-C (absolute)
Berberine	Has PCSK9 inhibitory properties, increases LDLR expression and decreases intestinal chol. absorption	300 mg/day	↓25 mg/dl
Artichoke	Luteolin interacts with HMG-CoA reductase, SREBPs, ACAT	500-2,700 mg/d	↓15 mg/dl
Garlic	Inhibition of HMG-CoA reductase	5-6 g/d	↓9 mg/d
Green tea	Inhibition of inducible NO synthase, inhibition of HMG-CoA reductase	170-1,200 mg/d	↓7 mg/dl

Summarized in Banach et al. *J Am Coll Cardiol* 2018;72:96-118.
Li et al. *J Biol Chem* 2009;284:28885-95.

A Case Study

34 year-old man with family history of heart disease is interested in lowering his cholesterol "naturally" (despite low 10-year est. ASCVD risk).



Take Home Points

- Recent history of and important concepts in clinical lipidology
  - Please consider non-HDL-C as well as LDL-C lowering, especially in hypertriglyceridemics
- New ACC/AHA Blood Cholesterol guidelines
  - Goal atherogenic cholesterol levels are both motivating and evidence based
- PCSK9 inhibition: when and how?
  - FH or ASCVD and LDL-C > 70 or non-HDL-C > 100 mg/dl

Take Home Points

- SGLT2 inhibition: inducing glycosuria improves outcomes
  - Discuss ASCVD benefits of DM drugs with PCP, endocrine
- Marine omega-3 polyunsaturated fatty acids and other “nutraceuticals”
  - May have a role, consider in statin intolerance/refusal
